

(a) Ground gap = 0

X: one station

Y: distinct stations

Root rewards: 8; peripheral rewards: 6

Commit a: **20**

Commit b: **26**

Certified preference: **b**

Conditional increments $V(d | B) - w(F)$; F contains independent z

(b) Ground gap = 4

X: one station

Y: distinct stations

Root rewards: 8; peripheral rewards: 6

Commit a: **20**

Commit b: **14**

Certified preference: **a**

Nine base inputs alias

$\varphi_0(a) = \varphi_0(b)$ on each side
Including resource-gap scalars

Missing statistic: edges inside $N(v)$

Before: $a = 0, b = 1$ | After: $a = 3, b = 1$
